

Working with Your Kubernetes Cluster

Anthony E. Nocentino

ENTERPRISE ARCHITECT @ CENTINO SYSTEMS

@nocentino www.centinosystems.com

Course Overview

Introduction

Exploring Kubernetes Architecture

Installing and Configuring Kubernetes

Working with Your Kubernetes Cluster

Overview

Using `kubectl` to Interact With Your Cluster
Application Deployments

Using kubectl

Primary CLI tool

Control your Kubernetes Cluster

Operations - what you want to do

Resources - what you want to do it to

Output - if there's output, its format

Operations - what do you want to do?

apply/create - create resource(s)

run - start a pod from an image

explain - documentation of resources

delete - delete resource(s)

get - list resources

describe - detailed resource information

exec - execute a command on a container

logs - view logs on a container

<https://kubernetes.io/docs/reference/kubectl/overview/#operations>

Resources - what do you want to do it to?

nodes (no)

pods (po)

services (svc)

..and many more

<https://kubernetes.io/docs/reference/kubectl/overview/#resource-types>

Output

Specify kubectl's output format

wide - output additional info

yaml - YAML formatted API object

json - JSON formatted API object

dry-run - print an object without sending it to the API Server

<https://kubernetes.io/docs/reference/kubectl/overview/#output-options>

kubectl

kubectl	[command]	[type]	[name]	[flags]
kubectl	get	Pods	pod1	--output=yaml
kubectl	create	deployment	nginx	--image=nginx

<https://kubernetes.io/docs/reference/kubectl/kubectl/>

<https://kubernetes.io/docs/reference/kubectl/cheatsheet/>

Demo

Using kubectl

- Nodes
- Pods
- API Resources
- Configure bash auto-completion

Application Deployment in Kubernetes

Imperative

```
kubectl create deployment nginx \
--image=nginx
```

```
kubectl run nginx --image=nginx
```

Declarative

Define our desired state in code

Manifest

YAML or JSON

```
kubectl apply -f deployment.yaml
```

Basic Manifest - Deployment

```
apiVersion: apps/v1
```

```
kind: Deployment
```

```
metadata:
```

```
  name: hello-world
```

```
spec:
```

```
  replicas: 1
```

```
  selector:
```

```
    matchLabels:
```

```
      app: hello-world
```

```
kubectl apply -f deployment.yaml
```

```
template:
```

```
  metadata:
```

```
    labels:
```

```
      app: hello-world
```

```
  spec:
```

```
    containers:
```

```
    - image: gcr.io/google-samples/hello-app:1.0
```

```
      name: hello-app
```

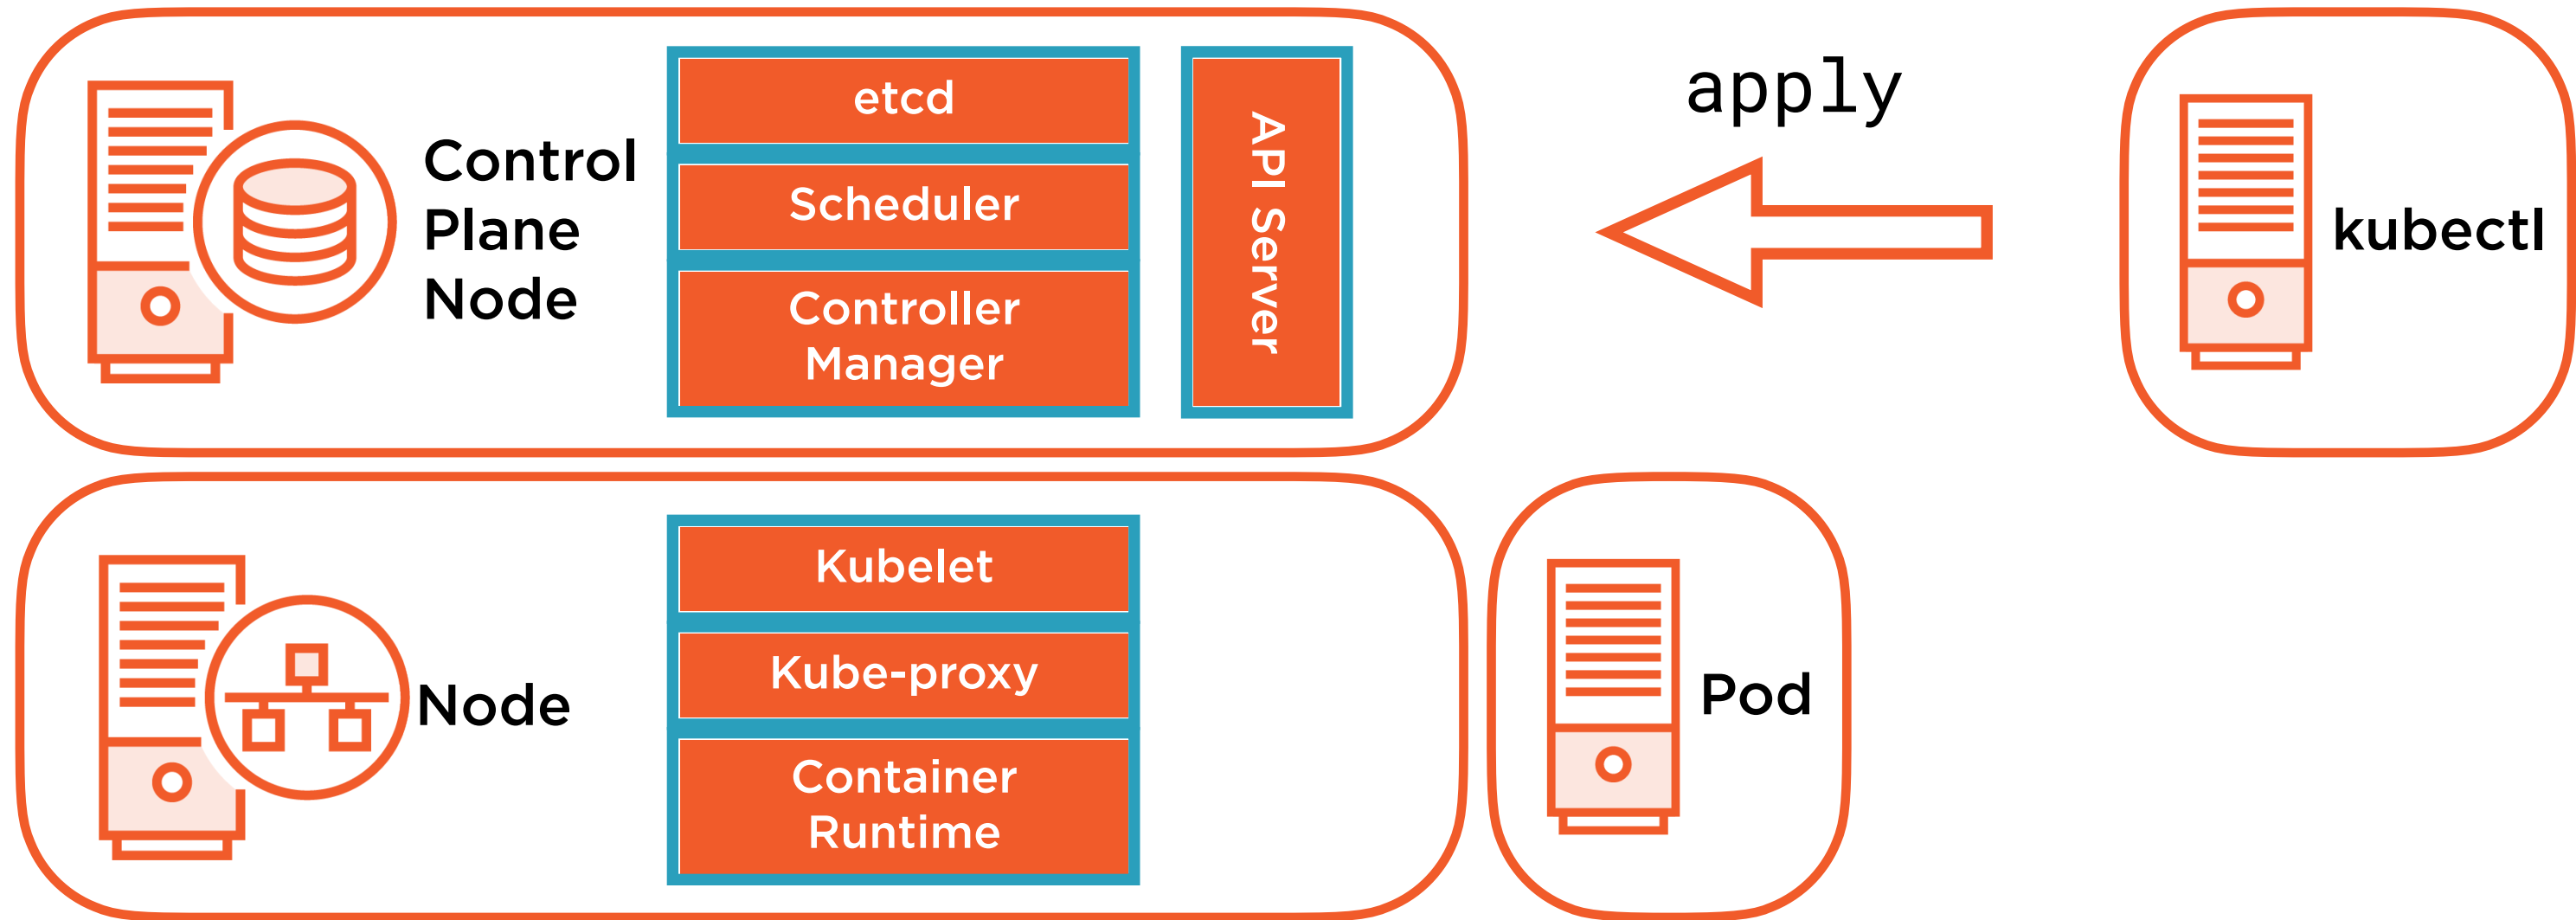

```
kubectl create deployment hello-world \  
  --image=gcr.io/google-samples/hello-app:1.0 \  
  --dry-run=client -o yaml > deployment.yaml
```

```
kubectl apply -f deployment.yaml
```

Generating Manifests with dry-run

Deployments

Application Deployment Process

Demo

Imperatively and Declaratively

Deploying resources in your Cluster

- **Deployments**
- **Pods**
- **Services**

Making changes to existing resources

Summary

Using `kubectl` to Interact With Your Cluster
Application Deployments

Thank You!
